LETTER OF APPROVAL

This is to certify that this project prepared by Srijana Subedi and Roj Dahal entitled "Library Management System" in partial fulfillment of the requirements for the degree of Bachelor in Computer Application has been evaluated. In our opinion it is satisfactory in terms of scope and quality as a project for the required degree.

Internal Examiner Prakash Subedi	External Examiner (Name)

ABSTRACT

The Library Management System (LMS) is a web-based application designed to automate and streamline library operations, enhancing efficiency in managing books, users, and transactions. Developed using PHP and MySQL, the system provides a robust and scalable platform for libraries to manage book inventory, track borrowing and returns, and ensure seamless access to library resources. Key features of the system include book cataloging, book issue and return tracking, fine calculation for overdue books. The LMS supports multi-user roles, including user and admin, ensuring appropriate access control and functionality. The system also provides real-time book availability updates, automated notifications for due dates and issued book. To enhance security, the system implements PHP session-based authentication for authorized access. Additionally, a search allows users to efficiently locate books based on title, author. By digitizing library operations**,** the LMS minimizes manual effort, reduces errors, and enhances the user experience.

Key words: Book management, Search, Availability, Issued book, PHP, MYSQL Database .

Acknowledgement

On this great occasion of the successful completion of our project, we would like to express our sincere gratitude to our Supervisor Prakash Subedi for his valuable guidance and continuous support throughout the development of this project.

We would also like to extend our heartfelt thanks to our Program Director Phul Babu jha, Deputy Director, and Coordinator Naw Raj Joshi for providing us with this wonderful opportunity to work on the **"Library Management System"**. Their support, encouragement, and insightful suggestions have been instrumental in the successful completion of this project.

Without their valuable guidance, this project would not have been possible. Their expertise and recommendations have helped us in various phases, from planning and design to implementation and testing. We truly appreciate their contribution and assistance.

Lastly, we assure that this project has been developed with our own efforts, and it is an original work.

Srijana Subedi

Roj Dahal

Chapter 1: Introduction

1.1 Introduction

Library Management System (LMS) is essential to effectively plan and oversee library operations, such as cataloging, borrowing, and returning books.[1]. It offers notable increases in productivity for administrators and users alike by automating manual tasks, optimizing workflows, and guaranteeing data accuracy.[2] An LMS reduces operational inefficiencies and improves the overall library experience by incorporating real-time functionality and user friendly features. Libraries need to update in the current digital era to stay current and user-focused. Conventional approaches, like paper-based records are frequently insufficient to meet the growing demand for smooth and effective services for the user as well as the administrators [3]. By offering tools for resource management, user engagement, and analytics, an LMS fills this gap and helps libraries accomplish their objectives and better serve their facilities to the user and make the system user friendly.

1.2 Problem Statement

- Inefficient and time-consuming manual tracking of book records.
- Frequent errors in calculating late fees and managing book returns.
- Limited visibility into book availability.
- Dissatisfaction among users due to outdated library management practices.
- Absence of real-time integration for user notifications and updates.

1.3 Objectives

- To design and implement a user-friendly system for managing library operations.
- To enable real-time cataloging, borrowing, and returning of books.
- To implement robust system for managing fines.

1.4 Scopes and Limitation

The scope of this project are as follows:

1. **Efficient Book Tracking and Management:** Tracks real-time availability and status of books (e.g., available, issued) and allows easy addition and deletion of books in the system.

2. **Book Borrowing and Returning:** Facilitates borrowing and returning processes as well send notifications for newly issued book and alert message when the book return date is near.
3. **Fine and Penalty Management:** Automatically calculates fines for overdue books.

And some limitations are:

1. High Initial Setup: The initial investment in hardware, software, and setup can be significant, which might be a hurdle for small libraries.

2. Scalability Limitations: The system may require costly upgrades or reconfigurations to handle larger libraries**.**

3. Learning Curve for New Users: Staff and users may require time and training to familiarize themselves with the system's functionalities.

1.5 Report Organization

This section describes how the report is organized.

1. Preliminary Section: This contains Title Page, Supervisor's Recommendation, Letter of Approval, Acknowledgement, Abstract, Table of Contents, List of Figures, List of Tables, and List of Abbreviations.

2. Introduction Section: This section deals with the background of the project, the Problem Statement, Objectives, Scope and Limitations. Requirement and Feasibility Analysis Section: This section contains the Literature review of the project, the requirements of the project, and the Feasibility Analysis performed.

3. System Design Section: This section deals with Methodology used for the solution of the problem and the algorithm used to solve the problem.

4. Implementation and Testing Section: This section deals with the implementation details, Testing and Results obtained.

5. Maintenance and Support Plan Section: This section discusses the Maintenance plan that will be performed and the support that the application will be provided.

6. Conclusion and Recommendation Section: This section deals with the conclusion of the project and recommendations for solving the limitations that occurred during the development of the project.

Chapter 2: Background Study and Literature Review

2.1 Background Study

Effective management of library resources is essential for ensuring accessibility and user satisfaction. Libraries play a vital role in providing knowledge and resources to users; however, traditional manual methods of managing library operations, such as cataloging, book issuance, and inventory tracking, often proved inefficient and prone to errors. These manual processes hindered scalability, resource optimization, and overall efficiency. This study explores the evolution of Library Management Systems (LMS), highlighting the advancements in technology and the challenges addressed by modern systems[1]. In earlier times, libraries relied heavily on manual record-keeping methods, such as ledger books and index cards, to maintain records of books, users, and borrowing transactions. Although functional, these systems were labor-intensive, time-consuming, and susceptible to inaccuracies.[2] As library collections grew in size, these manual systems struggled to meet user demands effectively. The introduction of computerized systems in the late 20th century revolutionized library management by automating core processes like cataloging, book circulation, and report generation.

2.2 Literature Review

A Library Management System (LMS) is a software solution designed to streamline and optimize library operations, including cataloging, borrowing, returning, and inventory management of books and resources. The integration of Agile technology in LMS provides a dynamic and adaptive framework for enhancing system functionality and user satisfaction.[1] Agile processes enable continuous improvement and rapid response to changing requirements, making it well-suited for modern libraries.

A S.W.O.T analysis for this system:

Strengths:

LMS enhances coordination between library departments, including adding book, cataloging, and circulation, ensuring better alignment with user needs and resource availability.

Weaknesses:

Agile processes require continuous testing and iteration, consuming significant time and resource. Risk of inconsistent implementation due to iterative workflows, potentially affecting system quality and extending project timelines.

Opportunities:

Agile LMS can integrate seamlessly with AI, machine learning, and IoT, enabling predictive analytics for book demand, automated reminders for due dates, and enhanced user engagement**.**

Threats:

Library staff and administrators are familiar to traditional systems may resist Agile practices, slowing adoption and reducing effectiveness. Real-time data and interconnected systems increase exposure to potential cyberattacks and data breaches, especially when integrating external services like cloud storage or third-party notifications.

In conclusion, the implementation of Agile technology in a Library Management System offers a flexible and user-centric approach to managing library operations. Agile LMS enables continuous improvement, better alignment with user expectations, and enhanced operational efficiency. However, addressing resistance to change and prioritizing data security measures are critical to ensuring the system's success.

Chapter 3: System Analysis and Design

3.1 System Analysis

Agile methodology is going to be used while building the website. It facilitates risk management, continuous improvement, and user-centric design. This project have specific documentation, various changes, frequent outputs, and well-understood technology. So ,to build this system, agile methodology can be used.

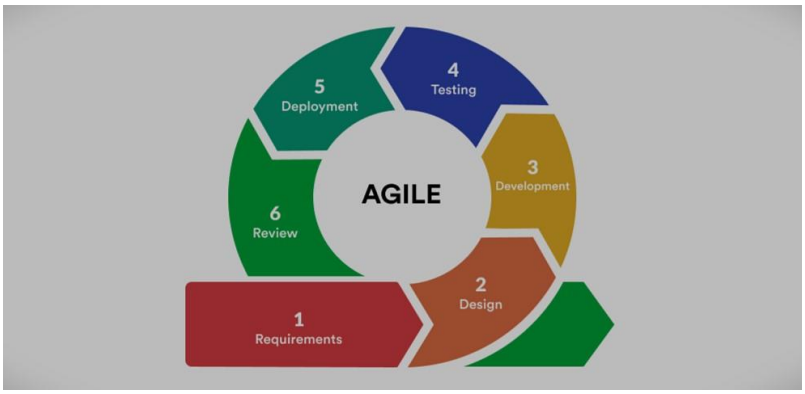

Figure 3.1: Agile Methodology

3.1.1 Requirement Analysis

Requirement analysis is done while developing a system and before implementing it. It is necessary to analyze the whole system requirement. There are functional and non-functional requirements to be considered while determining the requirements of the system which outline what the system should do and the quality standards it must adhere to:

i. Functional Requirements

Functional requirements outline the specific tasks that the system must perform to manage library effectively.

- Book Tracking and Management: The system should track real-time availability and status of books and also allow addition and deletion of books The system should automatically update book quantity when issued, returned.
- User Management and Access Control: The system should Manage user accounts with role-based access (admin, student) as well as monitor user borrowing history, fines, and account status.

- Book Borrowing and Returning: The system should facilitate efficient book borrowing and returning processes and track issued date and return date automatically as well as provide notifications for due date and newly issued book.
- Manage and Analytics: The system should manage book circulation (issued and returned) and user activity.
- Fine and Penalty Management: The system should automatically calculate fines based on overdue duration as well as track and notify the user about the due date.

Library Management System

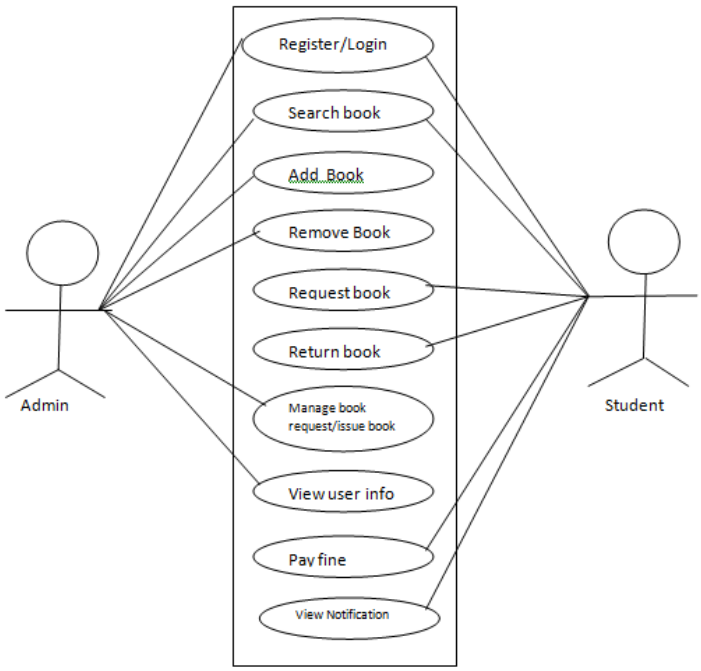

Figure 3.2: Use-Case Diagram

ii. Non-functional Requirements

These are the performance and quality attributes that the system must meet to ensure usability, reliability, and scalability.

- **Performance**: The system should respond quickly to user actions, with book searches, updates, and transactions processed within seconds. It must handle a large number of users and transactions without performance degradation.
- **Scalability**: The system must be scalable to accommodate a growing number of books, users, and transactions as the library expands.

- **Usability:** The user interface should be intuitive, simple, and require minimal training for users to navigate and use efficiently. Both administrators and members should be able to use the system.
- **Security:** The system must enforce strong authentication protocols (e.g., username, password) to protect sensitive data. User access must be controlled based on roles (e.g., admin, user), ensuring the right level of access to data and functionality.
- **Maintainability:** The system should be easy to maintain, enabling regular updates, bug fixes, and feature enhancements without disrupting operations. Documentation should be available for both users and developers for maintenance tasks.

iii. Technical Requirements

Technical requirements specify the hardware, software, and system environment needed for the system to function.

- Hardware Requirements: The system should run on standard server hardware or cloud infrastructure, with provisions for scalable storage and processing power.
- Software Requirements: The system should be developed using a backend (e.g. PHP) and a user-friendly frontend. It must use a reliable database system such as MySQL to store and manage data.
- Platform Compatibility: The system should be accessible via modern web browsers (e.g., Chrome).

3.1.2 Feasibility Analysis

The following are the feasibility study of Library Management System:

i. Technical Feasibility

The technical feasibility of the Library Management System (LMS) is highly favorable due to the use of widely available and supported technologies. PHP and JavaScript provide a flexible and robust foundation for web development, while a relational database like MySQL ensures data integrity and scalability.The system also employs session management, encryption techniques, and responsive design principles to enhance usability and security.

ii. Operational Feasibility

Operational feasibility of the Library Management System (LMS) focuses on how effectively the system can integrate into the library's day-to-day operations. The LMS is designed to streamline processes such as book tracking, borrowing and returning procedures, and fine calculation, replacing manual tasks and minimizing errors. It provides user-friendly interfaces for both admin and user, facilitating efficient management of library resources. With minimal training required, student can quickly adapt to the system, enhancing productivity.

iii. Economic Feasibility

Economic feasibility evaluates whether the Library Management System (LMS) is cost-effective. The development costs are primarily associated with software tools, web hosting, and database licensing. By utilizing open-source tools for most components, these costs are significantly reduced. The investment in the LMS is justified by improved operational efficiency, reduced administrative workload, and enhanced user satisfaction .The LMS can lead to cost savings through reduced labor, as automated processes replace manual tasks.

iv. Schedule Feasibility

Task	Start Date	End Date	Week 1	Week 2-3	Week 4-5	Week 6-9	Week 10-11	Week12
Planning	1- sept	20-sept						
Analysis	20-sept	5-oct						
Design	5-oct	19-oct						
Coding	19-oct	20-nov						
Testing	20-nov	28-nov						
Documentation	2-sept	11-jan						

Figure 3.3: Gantt Charts

Figure 3.3 represent the timeline of the project. The Phase will be completed on average of specified days. It include planning, analysis, design, coding, testing and documentation. These phase will be carried out on the following dates shown on the figure. Since agile methodology is used for the project , the process can be repeated on these days.

3.1.3 Data Modeling (ER- Diagram)

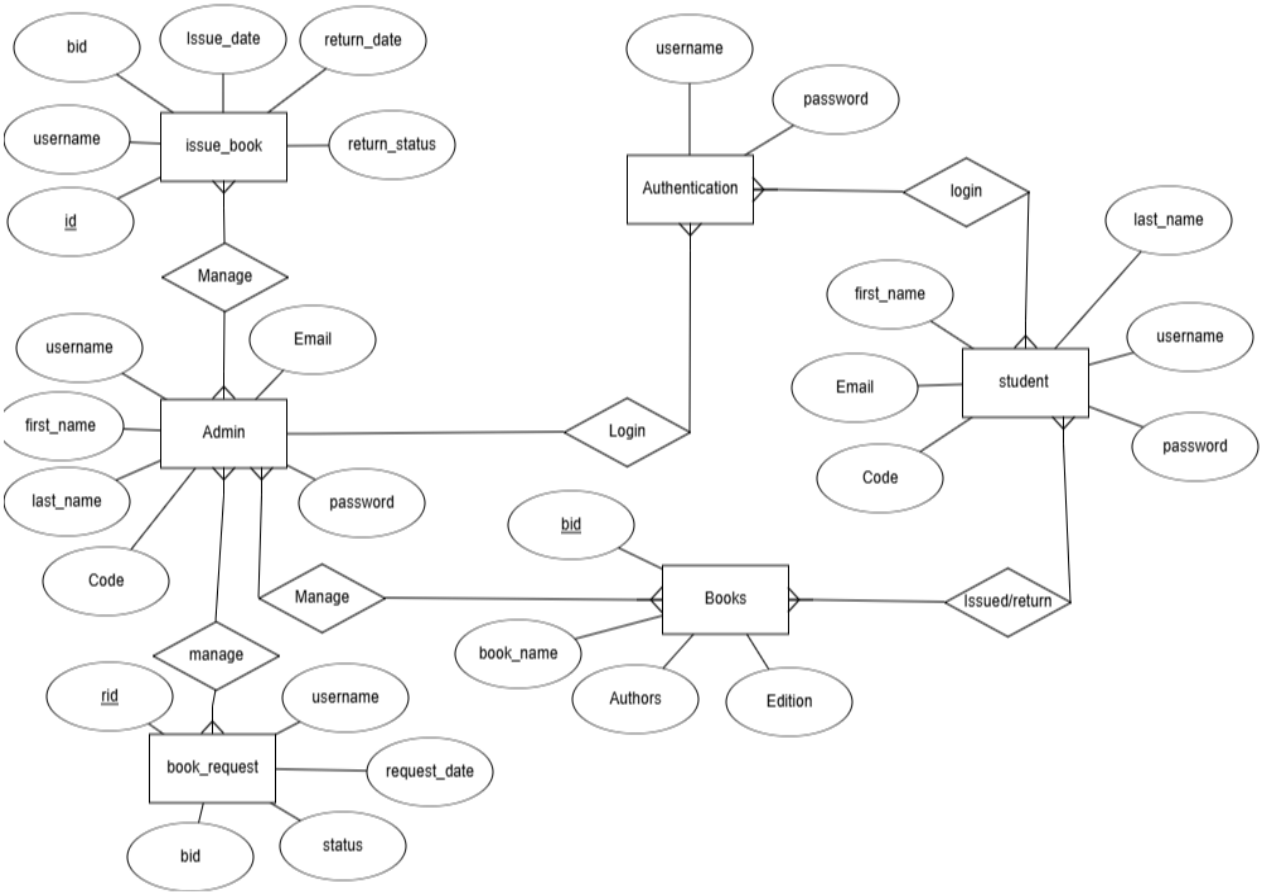

Figure 3.4: ER-Diagram

Figure 3.4 represent ER diagram of the Library Management System which illustrates the relationships between key entities such as Admin, student, Issue Book, Book Request, Fine, and Login/Registration. Student can request books, issued book, and may incur fines for late returns, while admin manage book request and issued books as well as books transaction. The Issue Book entity records book transactions, while the Book Request entity tracks requests . Overdue books result in penalties managed by the Fine entity. Secure access is ensured through the Login/Registration entity, handling authentication. The system ensures smooth library operations by tracking book circulation, user authentication, and fine efficiently.

3.1.4 Process Modeling (DFD)

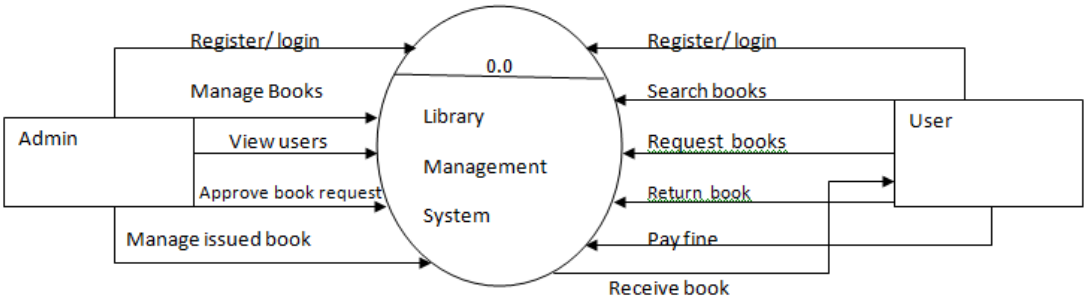

Figure 3.5: Process Modeling (DFD)

Figure 3.5 represent the Data Flow Diagram (DFD) for a Library Management System **,** illustrating interactions between Admin, User, and the System. The Admin can register/login, manage books, view users, approve book requests, and handle issued books. The User can register/login, search for books, request books, return books, and pay fines. The Library Management System acts as the central entity, processing user and admin requests while ensuring smooth book transactions. Arrows indicate the flow of data between the system and its users, showing key functionalities of the LMS.

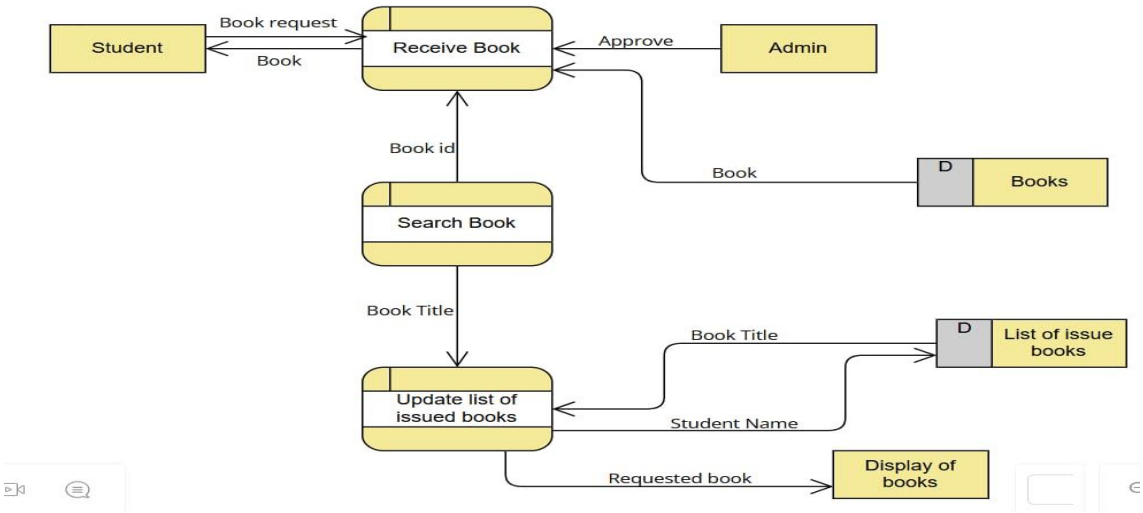

Figure 3.6: Level 1 DFD

The Level 1 DFD represents the book issuing process in a Library Management System (LMS). A student requests a book, which is processed by the "Receive Book" function and sent for admin approval. Once approved, the system searches for the book in the

database and updates the issued books. The updated data is stored in the “Issued Books" and displayed for users. The diagram includes processes like receiving requests, searching for books, updating records, and displaying issued books, ensuring efficient book management in the library.

3.2 System Design

3.2.1 Architectural Design

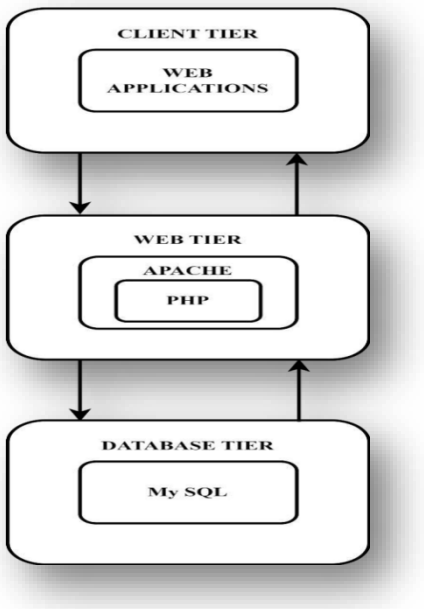

Figure 3.7: Architectural Design of Library Management System

This figure represents the three-tier architecture of a Library Management System **(LMS)**. The Client Tier consists of the web application where students and admin interact with the system through a browser. The Web Tier includes the Apache web server and PHP**,** which handle user requests, such as searching for books, issuing books, and managing books. The Database Tier consists of MySQL, which stores data related to books, users, issued books, and return requests. When a user requests a book, the web tier processes the request and retrieves data from the database. PHP interacts with MySQL to fetch or update book availability, user details, and transaction history. The processed data is then sent back to the client for display.

3.2.2 Database Schema Design

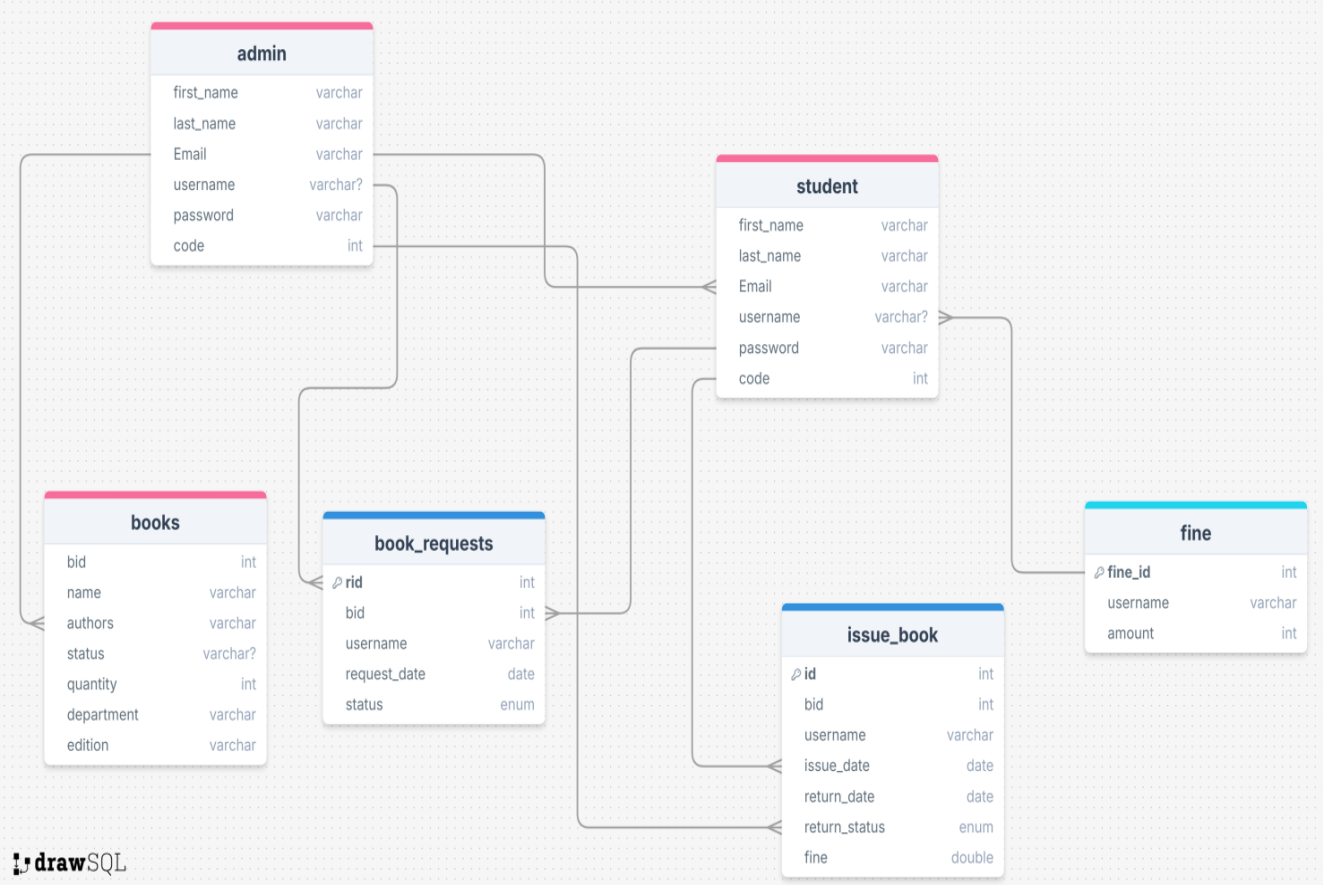

Figure 3.8: Database Schema Design of Library Management System

The Library Management System (LMS) schema diagram represents entities and their relationships. The admin and student tables store user details, including names, emails, usernames, passwords, and codes. The books table contains book details such as id, name, authors, status, quantity, department, and edition. The book requests table tracks book requests , request id , book id, username, request date, and status. The issue book table records issued books with details like issue id, book id, username, issue date, return date, return status, and fines. Lastly, the fine table stores fines associated with users, identified by fine id, username, and amount. The relationships between these tables help manage book transactions, requests, and fines efficiently within the system.

3.2.3 Interface Design

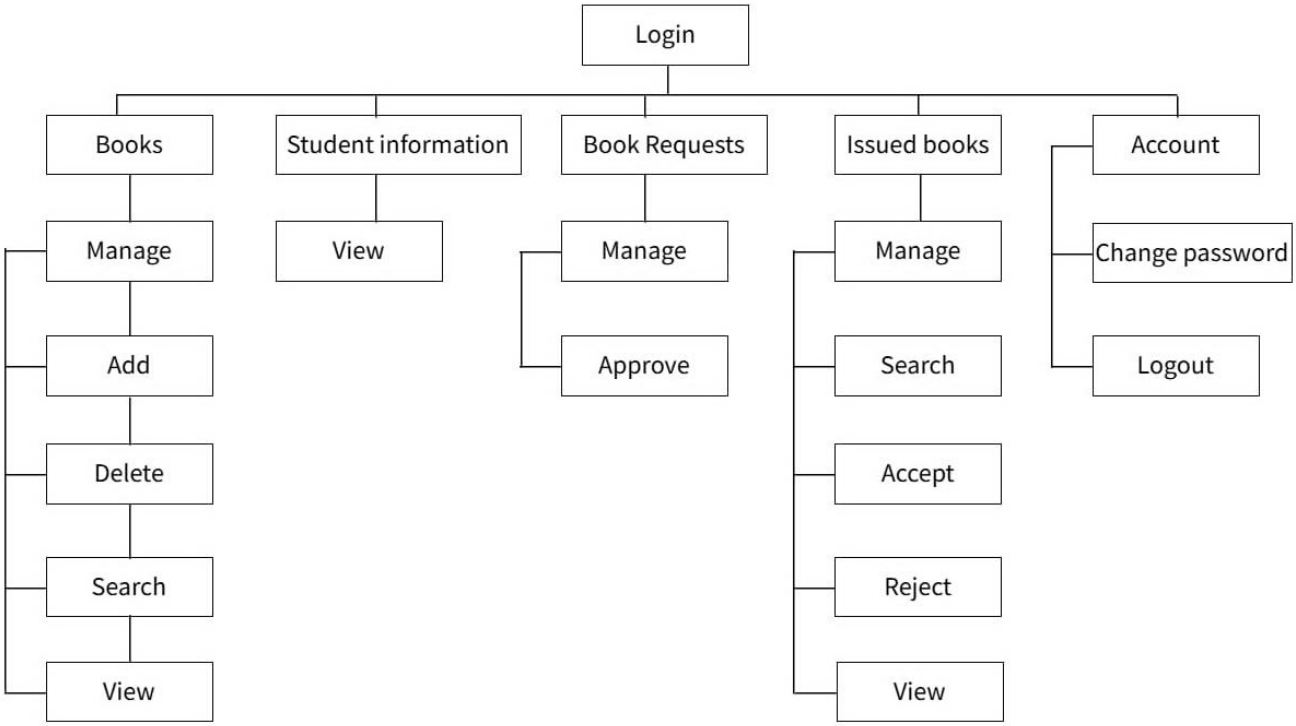

Figure 3.9: Admin Interface Design of Library Management System

This Admin interface represents the admin dashboard of a Library Management System (LMS), outlining key functionalities. The Login Page allows authentication

- Books Management: Admin can manage books by adding, deleting, searching, and viewing available books.
- Student Information: Provides an option to view student details.
- Book Requests: Admin can manage book requests and approve them if valid.
- Issued Books: Admin can manage issued books by searching, accepting, rejecting, and viewing issued books.
- Account Management: Admin can change their password and log out from the system..

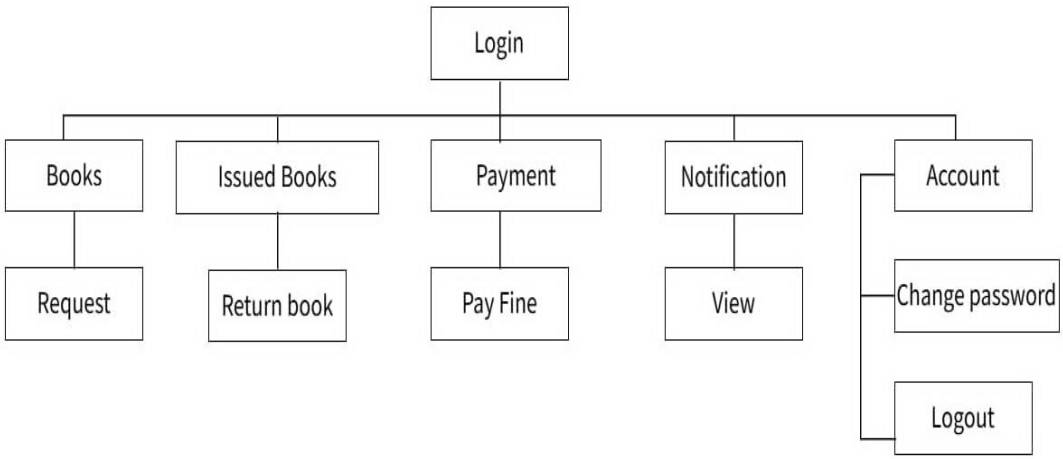

Figure 3.9: User Interface Design of Library Management System

This user interface diagram represents the Library Management System (LMS) - User Dashboard, outlining key functionalities available to library members.

- Login Page: Users authenticate to access the system.
- Books Section: Users can browse books and request them for borrowing.
- Issued Books: Displays books issued to the user and provides the option to request a return.
- Payment: Allows users to pay fines for overdue books.
- Notification: Users can view important alerts related to book issued and due date.
- Account Management: Enables users to change their password and log out securely.

Chapter 4: Implementation and Testing

4.1 Implementation

During the implementation phase of Project Library Management System, a combination of programming language, frameworks and development tools were utilized to create a comprehensive and user-friendly system.

4.1.1 Tools Used

1. Programming Language:

- PHP: PHP was chosen as the frontend programming language due to its versatility and extensive libraries for web development.

2. Framework:

- HTML and CSS : Html and Css was used to build the frontend web application, providing tools and libraries for handling requests, routing.

3. Database Management System:

- MySQL: MySQL was used to store and manage structured data efficiently, facilitating easy retrieval and storage of items and related information.

4. Version Control:

- Git: Git facilitated version tracking, collaboration among team members, and code management.

5. Frontend Development:

- HTML, CSS, Javascript : These core web technologies were used for creating the frontend user interface, ensuring responsiveness and interactivity.

6. Text Editor:

- Visual Studio Code: Visual Studio Code offered a feature-rich development environment with extension for react and web development.

7. Diagram:

- Plantuml and drawsql allowed for the easy creation of clear and visual representation of database relationships.

4.2 Testing

Testing is the process of determining whether the system works effectively and efficiently. Testing does not only include debugging. It also checks for quality assurance, validation and verification, reliability and availability estimation. Testing can be done indifferent levels.

4.2.1 Test cases for Unit Testing

The unit testing part of testing methodology is the testing of individual software modules or components that make up a web application or system.

Table 4.1: Login Test Case

SN	Action	Input	Expected Outcome	Actual Outcomes	Test Result
1	On Submit	Null	Enter Your Credential	Enter Your Credential	PASS
2	Enter username	No username	Incomplete submission	Username required	PASS
3	Enter Password	No Password	Incomplete Submission	Password required	PASS
4	Enter username and Password	Username and password submitted	Redirect to dashboard	Redirect to dashboard	PASS

Table 4.2: Registration test case

SN	Action	Input	Expected Outcomes	Actual Outcomes	Test status
1	Null Submit	NULL	Exception raise	All fields are required	PASS
2	Submit without First name and last name	No first name and last name	Incomplete Submission	First name and last name Required	PASS
3	Submit Without Username	No Username	Incomplete Submission	Username Required	PASS
4	Submit without password	NO password	Incomplete Submission	Password Required	PASS
5	Submit without Email	NO Email	Incomplete Submission	Email Required	PASS
6	Submit without Code	No code	Incomplete Submission	Code Required	PASS
7	Submit with all Requirements	First name, last name ,username, Password, Email, code Submitted	Successful Submission	Successful	PASS

Table 4.3: Add book test case

SN	Action	Input	Expected Outcomes	Actual Outcomes	Test status
1	Null Submit	Null	Exception raise	All fields are required	PASS
2	Submit without Book name and authors	Null	Incomplete Submission	Books name and authors required	PASS
3	Submit Without Edition	No Author	Incomplete Submission	Edition Required	PASS
4	Submit without Status	NO Status	Incomplete Submission	Status Required	PASS
5	Submit without Quantity	NO quantity	Incomplete Submission	quantity Required	PASS
6	Submit without Department	No department	Incomplete Submission	Department Required	PASS

4.2.2 Test Case for System Testing

Table 4.4: System Testing

SN	Action	Input	Expected Outcomes	Actual Outcomes	Test status
1.	User Login	Valid username & password	User is successfully logged in	User logged in successful	PASS
2	Book Search	Book title/author	available books is display	available books is display	PASS
3	Request book	Click the request	Book request send to admin	Book request send to admin successful	PASS
4	Book Return Request	Click the return book	Return request sent to admin	Return request sent successfully	PASS
5	Book Return Approval	Admin approves request	Book is marked as returned in system	Book is marked as returned	PASS
6	Fine Calculation	Return an overdue book	Fine is calculated and shown	Fine calculated and displayed correctly	PASS
7	Fine Payment	Go to fines and complete payment	Fine status updated to '0'.	Fine status updated to '0'	PASS
8	Book Quantity Update	Issue a book	Book Quantity decrease by 1	Book Quantity decrease by 1	PASS

Chapter 5: Conclusion and Future Recommendations

5.1 Outcomes

Through the development of the Library Management System (LMS), valuable lessons were learned that shaped the project's direction and contributed to its success. Defining a clear project scope, embracing Agile methodologies for adaptability, and ensuring effective communication were key to achieving project goals. The process involved thorough testing plans, continuous collaboration, and a focus on identifying and resolving issues early, ensuring a smoother development cycle. The outcomes of the project include a functional and scalable Library Management System, with features such as user management, book tracking, borrowing and returning processes, and fine management Additionally, the LMS provides a contribution to improving library management and facilitating easier book tracking and user interaction.

5.2 Conclusion

In conclusion, completing the project “Library management system” represents a significant milestone in the libraries. The successful development of library system makes a positive impact on book management. Through the collaborative efforts of the team, the project achieved its objectives, delivering a functional and user-friendly interface that enables users to update, delete and manage the book records. The project’s adherence to Agile methodologies demonstrated the value of iterative development and continuous improvement, resulting in a robust and adaptable solution. This endeavor not only depends on our technical skill in web development and project management but also reinforced the importance of effective communication, teamwork, and problem solving. As project “Library management system” contributes to school and college libraries and enhances our understanding of complex technologies, it stands as testament to innovation, collaboration, and the potential to positively impact lives through technology-driven advancement in book management.

5.3 Future Recommendations

While the Airline Reservation System has achieved its goals, there are several areas where further improvements can be made to enhance functionality and user experience. Future recommendations include:

Cloud-Based Solutions: Transition to cloud-based LMS for real-time access, scalability, and secure remote management of library operations.

Automation Technologies: Integrate barcode scanning, RFID (Radio Frequency Identification), and IoT devices to automate book tracking, reduce manual efforts, and improve accuracy.

Demand Forecasting: Use AI-powered analytics to predict book demand, helping libraries manage acquisitions efficiently based on borrowing patterns and seasonal needs.

Mobile Apps: Develop mobile applications for library users to search catalogs, reserve books, and track borrowing history on the go.

Offline Mode: Implement offline features for seamless access to library resources in areas with limited or inconsistent internet connectivity.
